Serenade thought of this one by herself.

First we tried just throwing the dots in random spots but then there was some strategies!

The strategy we used was making a path with no dots but fill all the other empty spots with blue dots. Like shown on slide 3. You need 4 dots to make the corners of a soiree but we asked ourselves how do we make a non-square with only four dots and we got a few answers on slide 6.

We tried many different ways but it seems like 10 is the most you can get.
